STURDI-SPACE METAL BUILDING KITS

These metal building kits use cold-formed steel and CEE sections that are bolted or screwed together to make clear span frames, columns and rafters. No welding necessary.

The ease and speed with which your crew can assemble a Sturdi Space Metal Building means you get a profitable project and your customers a solid low-cost option for their new metal building. Just sit down with your customer and let them choose from among five sizes with two eave heights. There are eighteen color choices of 26 gauge steel with warranties up to 40 years. Plus, there are a half-dozen customization options that let your customer make the Sturdi Space Metal Building the way they want it.

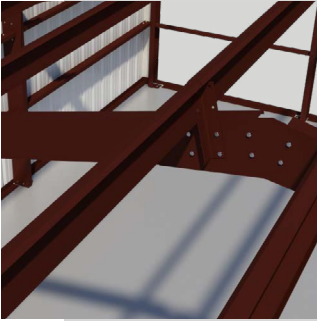

For many people even the basics will prove a challenge if they try to go it alone:

Checking local zoning regulations and obtaining a building permit, if required.

Site preparation requiring a workspace around the perimeter and access for the delivery truck.

Pouring a concrete foundation with embedded anchor bolts; not included in the building kit.

Using scaffolding, scissor lifts or tractors.

Your construction expertise used to build a Sturdi Space metal building means a healthy bottom-line for your business.
